PITCH DECK REVIEW

Sweet AI

Seed Round • AI Powered Custom Cake Platform

Reviewed by Sibilla Strupule • Pitch Authority

WHAT IT IS

Sweet AI is positioning itself as a technology platform, specifically an AI powered marketplace that connects consumers who want custom cakes with vetted local bakers. That is a clear, single identity, and the deck largely holds it throughout. The company leads with the platform, treats individual cake orders as the unit of transaction, and frames the baker network as the supply side infrastructure. That is the right framing for a seed stage raise.

There is one identity tension worth watching, and it lives on the Business Model slide. The 'Enterprise Licensing / API+' revenue stream introduces a B2B infrastructure angle that reads differently from the B2C marketplace narrative running through the rest of the deck. It is not a fatal contradiction, but it will invite investor questions. Right now the deck does not explain whether Sweet AI is a consumer brand, a SaaS tool for bakers, or an API business. It is trying to be all three simultaneously, and at seed stage, that dilutes the story.

> **Fix:** Lead with the platform and the consumer experience. Consolidate your B2B angle under one coherent framing: 'We are building the marketplace infrastructure. Enterprise licensing is how we monetise at scale with hotels and corporates.' Say it once, clearly, on the Business Model slide, and make sure your tagline reflects it.

PROBLEM

The four problem cards on Slide 2 are well chosen. Generic results, slow process, inaccessible pricing, and zero discovery are all real pain points that anyone who has tried to order a custom cake will recognise immediately. The emotional resonance is there. The problem statement is not.

What is missing is **quantification and urgency**. 'Bakeries guess at customer vision' is a description, not a problem with stakes. 'Average lead time 5–7 days' is a data point, but without context, what does it cost the customer when their cake arrives wrong? What percentage of custom orders fail to meet expectations?, it does not create urgency. 'Bespoke cakes cost $150–$400+' tells me the price range but not how many people are priced out or what the untapped demand looks like.

There is no ticking clock on this slide. The problem has existed for decades, so why does solving it matter **now**, at this moment? Investors need to feel urgency, not just empathy.

> **Fix:** Add one anchor statistic that puts scale on the pain: for example, what percentage of custom orders require revision or arrive unsatisfactory (even industry estimates work),

> or what share of celebration spend is lost because people default to supermarket cakes rather than navigate a complex custom process. Then give the timing argument: why is now the moment for AI to solve this, and what has changed technically in the last 12–18 months that makes this suddenly viable?

SOLUTION

The solution section has strong conceptual clarity. The three part structure, AI Design Engine, Real Time Preview, End to End Fulfilment, maps cleanly onto the problems raised in Slide 2. That architecture is right.

But this is where the deck asks investors to take the most on faith, and right now it gives them nothing to hold onto. **There is no proof that the AI actually works.** The claim that the model was 'trained on 200K+ cake designs' sounds substantial, but trained to do what? What is the output quality? Where is the before and after? A single image of an AI generated cake design, ideally compared against what a customer typed as a prompt, would do more for investor confidence than three slides of framework diagrams.

The IP situation is absent entirely. For any company claiming to be a technology platform, IP is not optional at seed stage. Are you pursuing patents on the model architecture? Trade secrets on the training dataset? Proprietary data relationships with bakeries? If an investor asks 'what stops DoorDash from building this in six months?', the current deck has no answer.

The 3D visualisation claim ('interactive 3D visualization') is ambitious. If this is live and working, it needs to be shown. If it is on the roadmap, say so clearly, because sophisticated investors will ask.

> **Fix:** Add one visual proof point of the AI in action, a prompt to design example, a before and after, a screenshot of the real time preview interface. If product images are not ready, a mockup is acceptable at seed stage as long as it is labelled as such. Separately, add two sentences on IP strategy: what you are building that is defensible, and how you are thinking about moats beyond first mover advantage.

NUMBERS

This section has a clear strength and a significant gap. The strength: you have actual GMV numbers from your beta ($28K over three months), and the traction timeline is well presented. That is real validation, and it should be front and centre. The gap: the unit economics deserve harder scrutiny than they will survive in a live investor meeting.

An LTV:CAC ratio of 18.9×, with a $18 CAC and a $340 LTV, is remarkable. It will raise eyebrows, not applause, unless you can defend every number. How was the $18 CAC calculated? Is this organic beta CAC, or does it reflect paid acquisition? Because those are very different businesses. And how was the $340 LTV derived? What is the assumed purchase frequency, and what data supports the retention assumption?

The revenue projection, from $28K GMV in Q3 2025 to $350K ARR by Q4 2026 and $3M ARR by Q4 2027, represents a roughly 107× increase over two years. That is not inherently unreasonable for a marketplace, but the deck does not explain the mechanism. What drives that growth? How many cities, how many bakers, at what conversion rates? Investors will do this maths in the room. You should lead the conversation.

The ask is $1.5M, and the use of funds breakdown is clear. But there is no explicit path from this raise to the next milestone. What does $1.5M get you, in measurable terms, that justifies a Series A at a higher valuation in 18 months?

> **Fix:** Add a footnote or callout that explains the CAC and LTV assumptions, even a single sentence per number. Then add one line to the financials slide that explicitly states your Series A milestone: for example, '$3M ARR across 20 cities with 60% gross margin unlocks our Series A.' That gives investors a success criterion, which is what they need to say yes.

WHY NOW

The Market Opportunity slide names the right macro trends, personalised gifts market growth, Gen Z premium willingness, celebration economy CAGR. Those are real tailwinds. But none of them are new. Personalisation has been a trend for years. The slide does not make the case for **why 2026 is the right moment** to fund this company specifically.

What is missing is a technological catalyst. The generative AI capabilities that make Sweet AI's core product possible, high quality image generation from text prompts, have only become commercially viable in the last 18–24 months. That is your 'why now.' The cost of building what you are building has dropped by an order of magnitude. The quality threshold has crossed the point where consumers will trust AI generated designs. Neither of these points appears in the deck.

The competitive landscape slide is the strongest slide in the deck. The comparison table is clear, honest, and well positioned. Sweet AI wins on every differentiated dimension, AI Design Preview, Real Time Customisation, Local Baker Network, B2B/White label. That positioning holds. The right move now is to pair it with a 'why now' timing argument that explains why the window is open and what closes it.

> **Fix:** Add a 'Why Now' callout, either as a standalone slide or a text block on the Market Opportunity slide, that names three specific changes: (1) generative AI reaching commercial quality for image design, (2) consumer trust in AI assisted personalisation crossing a threshold (cite data if you have it), and (3) the fragmented bakery market remaining undigitised despite 7+ years of food tech investment. That framing explains both the opportunity and the urgency.

WHY US

The team slide is credible but has one structural gap that investors will notice immediately. You have built a strong marketplace operator (ex DoorDash), a strong computer vision engineer (ex Pinterest, ex Google Brain), and a strong industry connector (15 years in specialty food). That is a compelling combination for building the supply side and the technology.

What is missing is **domain immersion on the demand side**. Who on this team has lived the problem as a consumer? Who has planned a wedding, a milestone birthday, a corporate event, and felt the specific friction that Sweet AI is solving? Investors bet on founders who have experienced the pain firsthand and made deliberate choices because of it. The deck does not make this case. It presents credentials without a founding story.

The other gap: there is no mention of advisors, angels, or institutional validators. At seed stage, a named advisor from the food tech or consumer marketplace world, someone with genuine credibility in the space, signals that serious people have evaluated this and believe in it. One line on the Team slide can carry significant weight.

> **Fix:** Add a two sentence founding story to the team section: why this team, why this problem, why now. It does not need to be personal in a vulnerable way, it just needs to answer the investor's implicit question: 'What gives you the right to own this category?' Then add one named advisor with a credible food tech or marketplace background. Even an informal advisory relationship, structured with equity, sends a signal.

SUMMARY OF TOP PRIORITIES

1. **Show the AI working.**
   This is the single most important fix before you walk into any investor meeting. The entire value proposition rests on the quality of the AI design output, and the deck currently asks investors to take this on faith. One real example, a text prompt alongside the generated cake design, would shift the credibility of every other claim in the deck. If the product is not yet live, a mockup clearly labelled as such is acceptable. The absence of visual proof is the first thing a sophisticated investor will notice and the last thing you want them to leave thinking about.

2. **Defend the unit economics or change them.**
   An 18.9× LTV:CAC is a headline number that will be probed hard. Walk through the assumptions in your appendix, purchase frequency, retention curve, blended CAC across channels. If the numbers hold under scrutiny, they are a genuine strength. If they do not, correct them now. A realistic 8–10× with clear assumptions is more fundable than a flashy 18.9× that collapses under questioning.

3. **Add the 'Why Now' argument explicitly.**
   The generative AI capability unlock of the last 18–24 months is your strongest timing argument and it is not in the deck. Name it. Pair it with the fact that the bakery industry remains the last large food category without a technology platform. That combination, technical unlock meets structural market gap, is your window, and investors need to believe the window is real and time limited.

4. **Clarify the B2B / Enterprise positioning.**
   Decide what the deck is leading with and hold that frame. If enterprise licensing and the API+ product are a 2028 ambition, do not give them equal billing with the B2C marketplace on the Business Model slide. If they are a genuine near term revenue stream, explain who the first three customers are and what a contract looks like in value. Mixed signals on business model at seed stage cost you meetings.

5. **Add a founding story and one named advisor.**

   The team is strong on paper. Make investors believe in the mission, not just the credentials. Two sentences on why this team built this company, and one named advisor who brings food tech or marketplace credibility, will do more for investor confidence than any additional credential.

6. **Add a path from this raise to the next.**

   State explicitly what $1.5M buys in measurable milestones, cities launched, bakers onboarded, ARR target, gross margin trajectory, and what those milestones enable. 'Series A ready at $3M ARR' is a start, but investors want to see the bridge, not just the destination.

The opportunity here is real. The celebration economy is large, the market is fragmented, and the AI capability unlock is genuine. The Sweet AI team has the right cross functional mix to build this. The gaps in this deck are fixable, none of them reflect a problem with the business itself. Address the proof of AI, defend the unit economics, sharpen the timing argument, and you have a fundable story. The bones are right. Now build the conviction layer on top.
